## Section A – Project Overview

---

### Introduction

Trammel Crow Company is proposing to develop Cowlitz County (CC) Parcel No.'s 507350102, 507350103, and 507350104 located between Rose Way and N. Pekin Road, south of Guild Road in Woodland, Washington. See the Vicinity Map in Appendix A. The development of this property will consist of the design and construction of two industrial warehouse buildings at approximately 655,000 and 276,000 square feet, respectively, and associated automobile and trailer parking. Required public improvements include: approximately 1,800 linear feet of half road width extension of Rose Way along the western property line; frontage improvements to N. Pekin Road along the eastern property line (approximately 1,500 linear feet); stormwater management, sanitary sewer and potable water extensions within Rose Way; and connecting the potable waterline between Rose Way and N. Pekin Road within an onsite public easement. Private site improvements include site grading, the construction of automobile and trailer parking, the construction of internal access roads, stormwater management, the installation of sanitary sewer and potable water services, fire protection, and lighting.

### Existing Conditions

#### *Onsite*

The overall property consists of three existing parcels, totaling approximately 70 acres of industrial zoned land along N. Pekin Road. The proposed property is undeveloped aside from a small residence in the southeastern corner, which is to be maintained. The existing ground is predominately covered with fescue. There are several forested wetlands onsite including an approximate 2.5-acre wetland (Wetland A) along the south property line, an approximate 0.75-acre wetland (Wetland B) deemed a Fish & Wildlife Habitat Conservation Area by Washington Department of Fish and Wildlife (WDFW) and the City of Woodland along the north property line, and two approximate 315 square feet wetlands (Wetlands C and D) along the west property line. There are also multiple white oak trees onsite. Appendix A contains an Existing Conditions map developed by Ecological Land Services (ELS) showing critical areas. The topography of the site gently slopes either south towards Wetland A or west towards the west property line. Wetland A outlets to a Consolidated Diking Improvement District (CDID) No. 2 owned ditch running adjacent to the southern property line which drains west adjacent towards the Columbia River. The existing runoff from the site is primarily overland flow with rainfall runoff sheet flowing towards one of the wetlands, which detain some of the storm runoff until it either infiltrates or evaporates. It can be reasonably assumed that storm runoff from larger rainfall events is discharged from Wetland A into the CDID No. 2 ditch, see the Pre-Developed Basin Map in Appendix A.

#### *Offsite*

The fully developed CalPortland Cement Plant located on CC Parcel No. 507750100, site address 1441 Guild Road, Woodland, WA 98674 appears to have a two celled stormwater pond located in the southeastern portion of the site adjacent to Wetland B. It is assumed this stormwater pond collects stormwater from the fully developed CalPortland Cement Plant and discharges into Wetland B at rates

matching conditions before the CalPortland Site was developed, per City of Woodland standards. It is also assumed that stormwater runoff from CC Parcel No.'s 507780100, 507770100, and 507760100 sheet flows into Wetland B. These parcels are partially developed with gravel driveways and covered storage buildings.

## Proposed Conditions

The required public improvements include extending Rose Way along the western property line, approximately 1,800 linear feet of half width road improvements consisting of a 25-ft pavement width, 1-ft gutter, curb, and sidewalk to City standards. Frontage improvements will be made to N. Pekin Road along the eastern property line, approximately 1,500 linear feet. These improvements consist of sawcutting the existing pavement, widening the road to a 21-ft pavement width, and the installation of a 1-ft gutter, curb, and sidewalk to City standards. Stormwater runoff from these public improvements will be addressed by installing curb cuts at intervals and roadway low points which will direct roadway runoff underneath the sidewalk into bioretention facilities located behind the sidewalks. The bioretention facilities will be located within an easement offset from the proposed right of way dedication and will be sized to provide 100% water quality treatment and infiltration. Five driveways along Rose Way and four driveways along N. Pekin Road are proposed for access to the site.

Proposed private site improvements include approximately 4,400 linear feet of internal access roads and automobile and trailer parking. Three stormwater combined wetpond/detention ponds will provide for treatment and flow control of runoff from the developed site. The three ponds will be located in the northeast corner (NE Pond), northwest corner (NW Pond), and center of the site (Center Pond), respectively. A series of catch basins will collect and convey stormwater runoff into one of the three ponds, see the Post-Developed Basin Map in Appendix A. After treatment and flow control, stormwater will be discharged into the CDID No. 2 ditch along the south property line.

The proposed improvements redirect stormwater runoff from Wetlands A and B, and stormwater improvements are designed such that treated stormwater will be discharged into Wetlands A and B at rates matching pre-developed rates, which will continue to feed the wetlands and not alter their existing condition. The NE and NW Pond will be designed to treat stormwater and outlet to Wetland B at rates matching pre-developed rates. A culvert pipe will be installed from Wetland B to the Center Pond to provide stormwater an outlet during large rainfall events. The Center Pond will discharge to the CDID No. 2 ditch at rates matching pre-developed rates. In addition, a portion of the roof runoff from Building B will be discharged to Wetland A at rates matching pre-developed rates.

This project will add more than 5,000 square feet of new impervious surface; therefore, all minimum requirements apply to this project.

## Section B – Approval Conditions Summary

---

Preliminary approval conditions associated with this project will be included in the Type II Site Plan review and will be addressed during final design. The proposed project follows the City of Woodland Stormwater Code and the Department of Ecology's Stormwater Management Manual for the Puget Sound Basin,

February 1992 Edition (The Puget Sound Manual). The bioretention facilities follow the Department of Ecology's Stormwater Management Manual for Western Washington, 2019 Edition (SWMMWW) which provides guidance for bioretention and is more conservative than The Puget Sound Manual.

## Section C – Downstream Analysis

---

The stormwater runoff from proposed improvements is detained onsite such that the peak release rates for the developed site for the 2-, 10-, 25- and 100-year 24-hour storm events do not exceed the respective predeveloped rates. Therefore, a downstream analysis is not applicable to this project.

## Section D – Quantity Control Analysis and Design

---

### Hydrologic Analysis

#### *Criteria*

WMC Chapter 15.12 Stormwater Management states for surface runoff leaving a developed site "The peak release rate for the two-, ten-, twenty-five-, and one-hundred-year design storms after development shall not exceed the respective predevelopment rates." To ensure these standards are met "the volume available for storing runoff in a stormwater facility shall be reduced by an assumed starting condition equivalent to an immediately prior two-year event." This condition was applied to the sizing of the stormwater ponds for the runoff from proposed improvements.

Rainfall totals for 2-, 10-, 25- and 100-year, 24-hour design storm events for the Woodland area were determined from the isopluvial maps for design storms in Cowlitz County listed in the NOAA Atlas 2, "Precipitation Frequency Atlas for the Western United States, Volume IX – Washington". The rainfall totals were 2.40 inches per hour (in/hr), 3.41 in/hr, 3.79 in/hr, and 4.55 in/hr for the 2-, 10-, 25- and 100-year, 24-hour design storm events, respectively.

The existing conditions were described in Section A, Existing Conditions. The existing land use is modeled as meadow or pasture. The proposed improvements for the site are described in Section A, Proposed Conditions. For preliminary modeling purposes, the proposed land use is considered to be a combination of roofs, road/parking, landscape/grass, and pond water surface area. The developed site for the proposed road improvements is divided into three basins (NW, NE, and Center), as shown on the basin maps in Appendix A. See the modeling results in Appendix B for land use values.

#### **Results**

The proposed bioretention facilities were designed per BMP T7.30 of the SWMMWW to fully infiltrate stormwater runoff from the Rose Way and N. Pekin Road public road improvements. The bioretention facilities will be constructed with 6-inches of freeboard, a 1-foot ponding depth, a 2-foot minimum bottom width, 3 horizontal to 1 vertical side slopes, 3-inches of coarse compost, 18-inches of Ecology's default bioretention soil mix, which has an initial saturated hydraulic conductivity (Ksat) of 12 inches per hour, and a 6-inch underdrain pipe installed within 2-ft of crushed rock. See the bioretention facility detail on the Type II Site Plan submittal drawings.

Preliminary bioretention facility sizing to treat and infiltrate 100% of the stormwater runoff was modeled with the Western Washington Hydrology Model (WWHM). A Ksat safety factor of 4 (for greater than 5,000 square feet of pollution-generating impervious surface) was used. The bioretention facilities with a total bottom length of 1,410 linear feet (as shown in the Site Plan Drawings) are modeled to treat and infiltrate 100% of the stormwater runoff. Preliminary sizing uses infiltration rates as described in Section G – Soils Evaluation with a safety factor of 2.5 per SWMMWW and biofiltration facility sizing will be verified with measured infiltration rates with the final Technical Information Report (TIR).

The proposed detention ponds were designed to detain the runoff from the three basins. Based on the single event hydrograph modeling using HydroCAD, the required storage volume was sized such that the combined peak release rates from the ponds in the developed condition shall not exceed the peak onsite and offsite runoff rates from the pre-developed 2-year 24-hour storm condition; and the 10-year, 25-year, and 100-year 24-hour storm. A storm culvert will be installed between Wetland B and the Center Pond allowing Wetland B to outlet stormwater runoff from large rainfall events into the Center Pond. Wetland B currently receives offsite stormwater runoff as described in Section A Existing Conditions; therefore, peak runoff rates from these offsite areas were included in the HydroCAD model and will be bypassed through the storm conveyance system. A starting condition equivalent to an immediately prior two-year event was assumed for each of the proposed stormwater facilities. Modeling results for the ponds, with the surface areas as shown in the Site Plan Drawings, indicate a total depth required of 3-feet is needed to provide the required storage volume.

The existing area draining to Wetlands A and B were modeled in HydroCAD and an area of roof was selected such that the peak runoff rate from the developed roof area shall not exceed the peak runoff rate into Wetland A from a pre-developed 2-year 24-hour storm condition; as well as the 10-year, 25-year, and 100-year storms.

## **Quantity Control System Design**

The proposed stormwater quantity control design meets or exceeds the City of Woodland Stormwater Code requirements and the 1992 Puget Sound Manual. Flow control for stream bank protection is accomplished through detention of stormwater runoff from the proposed private site improvements to achieve the required pre-developed release rates.

Groundwater is anticipated to be between 5 to 10 feet below ground surface, see Section G. Existing ground elevations range from 18 to 23 with the exception of wetland and ditch bottoms; therefore, the anticipated groundwater elevation is approximately elevation 13. Detention volumes have been designed at or above elevation 17; therefore, adequate separation between live detention volume and the anticipated groundwater elevation will be provided.

## **Quantity Control System Plan**

Further design details for the facilities, ponds and outlet structures will be included with the final design.

## Section E – Conveyance System Analysis and Design

Per City of Woodland Stormwater Code, the conveyance system was sized to pass the 100-year, 24-hour design storm in open flow conditions. The stormwater conveyance system is designed with 12-inch through 36-inch diameter corrugated polyethylene storm sewer pipe at minimum slopes and capacities as shown in the table below such that the minimum velocity within the pipe is 2.5 feet per second to prevent siltation.

Pipe Diameter (in)	Minimum Slope (ft/ft)	Capacity (cfs)
12	0.0030	1.95
15	0.0023	3.10
18	0.0018	4.46
24	0.0012	7.84
30	0.0009	12.31
36	0.0007	17.65

The conveyance system connects the catch basins and conveys stormwater to one of the three ponds. In general, stormwater pipes furthest upstream from the ponds begin at 12-inch diameter and upsize as additional flow from each drainage area requires a higher capacity pipe up to a maximum of 36-inch diameter pipe.

## Section F – Water Quality Design

This project will add more than 5,000 square feet of new pollution-generating impervious surface (PGIS); therefore, basic treatment is required.

The treatment of the new public impervious surface will be addressed through the use of bioretention facilities as described in Section D. The bioretention facilities were sized using WWHM to infiltrate 100% of stormwater runoff from public improvements; therefore, the water quality treatment criteria per the SWMMWW to treat 91% of stormwater runoff from PGIS's is also satisfied.

The treatment of the new private impervious surface for this project will be addressed through the use of wetponds. Wetponds are designed by utilizing a storage area underneath required detention storage for treatment, thus creating ponds with both live storage for detention and dead storage for treatment. The treatment BMP's are designed using the 6-month, 24-hour water quality design storm runoff volume defined as 64% of the 2-year, 24-hour design storm, or 1.54 inches. This volume is modeled in HydroCAD; see Appendix B for modeling results.

The proposed wetponds are designed per BMP RD.05 of the Puget Sound Manual to meet or exceed the water quality design storm runoff volume, with the layout consisting of two to three cells, a minimum 3-foot depth and length to width ratios between 3:1 and 7:1. Pond inlets are typically located on opposite sides of the pond from the pond outlet, where possible, to promote hydraulic residence time. Specific wetpond construction details and notes will be prepared with the final design and final TIR.

## Section G – Soils Evaluation

---

Using the USDA Natural Resources Conservation Service (NRCS) the soils for this property have been identified as Clato silt loam with 0 to 3 percent slopes, Caples silty clay loam with 0 to 3 percent slopes, and Newberg fine sandy loam with 0 to 3 percent slopes. The majority of the developable site is underlain by Clato silt loam, Wetlands A, C, and D are underlain by Caples silty clay loam, and Wetland B is underlain by Newberg fine sandy loam as shown in the soils map in Appendix A. The Clato soil is classified as a soils hydrologic group B, the Caples soil is classified as a soils hydrologic group C/D, and the Newberg soil is classified as hydrologic soil group A.

A Due Diligence Geotechnical Report for the Woodland Bozarth Site Development project performed for the proposed improvements by NV5 dated January 26, 2023, is included in Appendix C. As noted in the report, mud rotary drilling methods prevented the direct measurement of groundwater in drilled borings; however, increased moisture of soil samples was observed at depths of approximately 10 to 15 feet below ground surface. Porewater dissipation testing in core penetration tests indicated groundwater was present at depths of 9.5 to 12 feet below ground surface at the time of testing. NV5 anticipates static groundwater will generally be between 5 and 10 feet below ground surface. See the report in Appendix C for additional information.

Infiltration testing was not performed as a part of NV5's Due Diligence Geotechnical Report. For preliminary stormwater modeling, infiltration testing from Rose Way Industrial Park, a nearby industrial development located just north on Parcel No. 508310100, Site Address 1435 Guild Road, was used. Infiltration tests were performed by Columbia West Engineering, Inc. on May 11, 2017. An Exploration Location Map showing measured infiltration rates and locations is provided in Appendix C. For preliminary stormwater modeling, a measured infiltration rate equal to the average measured infiltration rate at the Rose Way Industrial project site of 2.46 inches per hour was used. The onsite infiltration rate will be measured with infiltration testing for final design.

## Section H – Special Reports and Studies

---

An Oak Tree Protection Plan was prepared by Arbor Science Tree Care dated September 13, 2023.

A Cultural Resources Report was prepared by Archaeological Investigations Northwest, Inc. dated January 19, 2023, and will be submitted with the Type II Site Plan.

Ecological Land Services has performed a wetland categorization and delineation and is working with the City of Woodland, United States Army Corps of Engineers (USACE), Department of Ecology (DOE), and Washington Department of Fish and Wildlife (WDFW) to prepare the required environmental reports and permits, see Section I.

The proposed site is protected by a dike and therefore is not considered to be in a floodplain and the site is not located within the shoreline management area.

## Section I – Other Permits

The proposed construction for this project will disturb over an acre of land; therefore, a Construction Stormwater Permit and a Stormwater Pollution Prevention Plan is required for this project. A Temporary Sediment and Erosion Control (TESC) plan will be prepared as part of the civil design.

Additional permits that should be considered for design include:

- Excavation and grading permit
- Right of way permit

The proposed construction will also impact Wetlands C and D and the buffers of Wetlands A and B; therefore, additional permits that should be considered for environmental impacts are summarized in the table below:

Agency	Complete Application Documents	Permit
City of Woodland	<ul style="list-style-type: none"><li>• SEPA Checklist</li><li>• Variance Application</li><li>• JARPA Form</li><li>• Critical Areas Report</li><li>• Onsite Mitigation and Bank Use Plan</li></ul>	SEPA Decision Variance
USACE	<ul style="list-style-type: none"><li>• JARPA Form</li><li>• Critical Areas Report</li><li>• Onsite Mitigation and Bank Use Plan</li></ul>	Nationwide Permit 39
DOE	<ul style="list-style-type: none"><li>• JARPA Form</li><li>• Critical Areas Report</li><li>• Onsite Mitigation and Bank Use Plan</li></ul>	Letter of Authorization or 401 Water Quality Certification
DOE	<ul style="list-style-type: none"><li>• SEPA Decision</li><li>• Notice of Intent</li><li>• Stormwater Pollution Prevention Plan</li></ul>	Construction Stormwater Permit
WDFW	<ul style="list-style-type: none"><li>• SEPA Decision</li><li>• JARPA Form</li><li>• Critical Areas Report</li><li>• Onsite Mitigation and Banks Use Plan</li></ul>	Hydraulic Project Approval

\* SEPA = State Environmental Policy Act

\*\* JARPA = Joint Aquatic Resource Permit Application

## Section J – Ground Water Monitoring Program

A ground water monitoring program is not required for this project at this time.

## Section K – Operations and Maintenance Manual

An Operation and Maintenance Manual and maintenance agreement will be prepared with the final TIR for stormwater facilities to be privately maintained.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Cowlitz County, Washington

Survey Area Data: Version 23, Aug 31, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 26, 2022—Oct 11, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

<b>Totals for Area of Interest</b>			<b>92.0</b>	<b>100.0%</b>

### Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

**PROJECT REPORT**

## *General Model Information*

Project Name: 07880259 Rose Way Extension  
Site Name: Bozorth  
Site Address: N Pekin Road  
City: Woodland, WA  
Report Date: 11/14/2023  
Gage: Longview  
Data Start: 1955/10/01  
Data End: 2009/09/30  
Timestep: 15 Minute  
Precip Scale: 1.000  
Version Date: 2021/08/18  
Version: 4.2.18

## *POC Thresholds*

---

Low Flow Threshold for POC1: 50 Percent of the 2 Year

High Flow Threshold for POC1: 50 Year
