## **1 INTRODUCTION**

Layne, d/b/a Ranney Collector Wells (Ranney), has recently completed the redevelopment of three (3) existing laterals and the installation of three (3) new laterals in a horizontal collector well for the City of Woodland, Washington as part of the Ranney Well Improvement Project. The maintenance work was conducted in accordance with Sections 01010, 15100 and 15200 of the contract specifications. The following document details the maintenance procedures and performance testing results, along with recommendations regarding future operation of the well.

### **1.1 PROJECT BACKGROUND**

The City of Woodland currently utilizes a Ranney Collector Well as its sole source of raw water. The well is situated on the west bank of the Lewis River along Highway 503 (Lewis River Road) between Millard Avenue and North Goerig Street (Figure 1).

Initial hydrogeologic testing of the site was conducted in 1967. The aquifer at the well site reportedly has a transmissivity of 170,000 gallons per day per foot (gpd/ft) at a groundwater temperature 52° F. The aquifer is comprised of a 12.5-foot thick layer of sand and gravel between the elevations of approximately -2 feet and -14.5 feet (NAVD88), which is overlain and underlain by silty sand (Ranney Method Western Corp., 1967). Using these parameters, it was estimated that a collector well could yield up to 4.2 million gallons per day (MGD) with 10 feet of drawdown (Ranney Method Western Corp., 1967).

Construction of the Ranney Collector Well was completed in September 1968. A summary of the design details of the collector well is presented in Table 1. A plan view showing the orientation of the laterals is presented in Figure 2. Originally there were a total of eight 10 $\frac{3}{4}$ -inch outside diameter (OD) horizontal laterals installed (see Figure 2, attached). Laterals 1, 2 and 3 were originally intended to be the potable water producing laterals, but they, and Lateral 2B deflected downward during installation and the resulting water quality (elevated iron concentrations) essentially required them to be blanked off and taken out of service. Laterals 4 and 5 were projected away from the river to serve as interceptor wells in an attempt to draw in groundwater with the elevated iron concentrations, to allow Laterals 3B and 4B (projected higher in the formation and toward the river) to be used to develop the drinking water supply (Ranney Method Western Corp., 1968). Performance testing results (utilizing Laterals 3B and 4B, and landward Laterals 4 and 5) indicated that with 10 feet of drawdown the well could yield up to 4 MGD (Ranney Method Western Corp., 1968).

Because of continuing problems with iron content in the water, an attempt was made to use Laterals 4 and 5, and later also Lateral 2, to recharge water to the aquifer in 1987. Unfortunately, recharging water into Laterals 4 and 5 created problems with surface subsidence, and the practice was discontinued (Ranney Method Western Corp., 1987). Plugging with precipitated iron has necessitated repeated redevelopment of the laterals.

A summary of the maintenance history of the Ranney Collector Well is as follows:

- 1969 – Well was placed in to operation
- 1973 – Laterals 4 and 5 were redeveloped
- 1984 – Laterals 4, 5, 3B and 4B were redeveloped
- 1987 – Laterals 4 and 5 were redeveloped
- 1987 – Recharge system was installed, initially utilizing Laterals 4 and 5, later Lateral 2 was added to the recharge system
- 1994 – Laterals 2, 4, 5, 3B and 4B were redeveloped
- 1997 – Laterals 2, 3B and 4B were redeveloped, and the recharge system was dismantled
- 2007 – Laterals 1, 2, 3, 3B and 4B were redeveloped, Lateral 1 was closed due to poor water quality and Lateral 3 was closed due to a break

During the redevelopment in 2007, Laterals 1, 2, 3, 3B and 4B were cleaned and evaluated in an attempt to optimize the number of laterals that could be used to develop the raw water. Lateral 1 was found to produce poor quality (black) water and was subsequently closed. Lateral 3 appeared to have a break at a distance from the well (about 95 feet out) and was producing sand. This lateral was also closed to prevent sand migration into the well and pumps.

Following the 2007 redevelopment, only Laterals 2, 3B and 4B were being used to produce water and they include only 143 lineal feet of screen (total) since the first 49-56 feet of each line is blank pipe. At design entrance velocities of 1-2 feet per minute, this means that the mechanical capacity of the well should be fall between 550 - 1100 gallons per minute (gpm). Testing following the maintenance work in 2007 indicated that yields up to 3.3 MGD or about 2300 gpm under average conditions, should be possible, indicating that additional well screen would be needed to match the mechanical capacity to the projected yields (Ranney, 2007).

Water level and pumping rate data collected by the City indicated that the specific capacity of the well had declined from 211 gallons per minute per foot of drawdown (gpm/ft) following the 2007 redevelopment to about 40 gpm/ft in 2013. Given the recent issues with the Ranney Well, the City elected to evaluate the feasibility of installing new laterals to increase the capacity of the well. The City desires that the Ranney Well to be capable of producing a raw water supply of at least 3 MGD, which is the maximum design rate of the water treatment plant.

Layne - Ranney Collector Wells was contracted by the City to assist with a test drilling program to determine the potential for installing new laterals in the Ranney Well. The drilling program was completed in December 2012, with the detailed findings being presented in the February 1, 2013 report. In summary, two (2) test borings were drilled (designated TB1-12 and TB2-12) at the site with hydraulic interval testing being completed on both borings. Following testing, TB2-12 was converted to a 2-inch PVC observation well. The logs for these borings along the existing 6-inch observation well (AAI-523) are included in Appendix A for reference. Based upon the drilling and testing results, it was recommended that three (3) new 12-inch diameter

150 feet laterals be installed at a centerline elevation of approximately -10 feet NAVD88 (Layne, 2013). The final locations of any new laterals would be determined once the caisson was dewatered and be dependent on the actual locations of the existing laterals.

## **1.2 REPORT ORGANIZATION**

The material in the report is presented in the following sections:

Section 1.0 – Introduction

Section 2.0 – Maintenance Procedures: presents procedures used to redevelop the existing laterals and during installation of the new laterals.

Section 3.0 – Testing Results: presents the performance testing results,

Section 4.0 – Estimated Yield: presents projected yields under varying conditions,

Section 5.0 – Summary and Recommendations: presents a summary report and recommendations,

Section 6.0 – References: presents a list of references cited in the report.

## **1.3 LIMITATIONS**

This report was prepared for the exclusive use of the City of Woodland for the specific application and purposes as specified in the report. Conclusions reached in this report are based upon the objective data available to us at the time of forming our opinions and the accuracy of the report depends upon the accuracy of these data. Every effort is made to evaluate the information by the methods generally recognized to constitute accepted standard practices for groundwater investigations at the time of rendering the report and the conclusions reached therein to represent our opinions. Ranney cannot be responsible for actual conditions proved to be materially at variance with the data collected or supplied to us, upon which our opinions are based.

## **2 MAINTENANCE PROCEDURES**

The Ranney Well maintenance was conducted by Ranney from March 17<sup>th</sup> through early July 2014, with post-maintenance performance testing being completed in early August 2014. Work accomplished included the following:

- Task 1: Mobilization and set up.
- Task 2: Redevelopment of existing laterals using a high pressure rotating water jet.
- Task 3: New lateral installation
- Task 4: Site clean-up and demobilization.
- Task 5: Conduct post-maintenance evaluation.
- Task 6: Document redevelopment procedure and results in a report.

### **TASK 1 – MOBILIZATION/SET-UP**

Prior to mobilization, one (1) of the turbine pump assemblies were removed by Triangle Pump and Equipment, Inc. of Ridgefield, Washington. Equipment and personnel were then mobilized to the site and the Site was secured for work on March 17<sup>th</sup>. Once onsite, Ranney assisted Triangle Pump and Equipment with the removal of the two (2) remaining turbine pump assemblies. A temporary construction pump was set in the well to dewater the well and remove materials during the redevelopment and lateral installation processes. The Ranney Well is the City's sole source of water and could not be taken out of service during the maintenance activities. In order to provide water the WTP during maintenance, two settling tanks were setup to remove solids before pumping the water to the WTP. The primary settling tank was about 30 cubic yards and provided most of the detention time for settling solids from the construction and development water. The second tank (clean water tank) was divided by a baffle wall. The first bay provided additional settling time from solids, while the second bay served as the suction reservoir for the high service pump (HSP).

### **TASK 2 – EXISTING LATERAL REDEVELOPMENT**

In order to avoid confusion, the existing lowest tier lateral (Lateral 2) has been re-designated as Lateral 2A. Following setup, existing Laterals 2A, 3B and 4B were mechanically redeveloped using a high pressure rotating water jet equipped with a flushing wye under the controlled conditions of a fully dewatered caisson. The high pressure jet system was projected the attainable length of each lateral. The jetting assembly was hydraulically projected at a controlled rate to insure thorough cleaning. Redevelopment was continued until sand production from each isolated section of screen had reached stability and could not be improved further. Following redevelopment, these laterals were manifolded together and connected to a 20 HP submersible clean water pump. This pump was piped directly into the high service pump (HSP) inlet to provide water to the WTP during non-maintenance hours. The valves on the existing unused laterals were removed and blind flanges were placed on the ports.

### **TASK 3 – NEW LATERAL INSTALLATION**

Ranney examined the caisson, existing lateral layout and adjacent boring logs to determine the locations for the new laterals. The centerline of the new laterals was selected to be at an elevation of -9.0 feet NAVD88.

Three (3) stainless steel port assemblies were installed for the projection of the new laterals. These assemblies installed in circular openings cut in the caisson wall at the selected locations and bonded to the caisson by grouting. During this process, projection equipment, pipe and tools were lowered into the well and set up.

The laterals were constructed by initially projecting 16-inch OD drive pipe to the desired length and sampling the aquifer materials as the pipe was projected. Next sieve analyses of the selected samples were performed and recommendations for screen slot size were made. The 12-inch ID stainless steel (type 304) wire-wrapped screen assemblage was installed within the projection pipe and the pipe was hydraulically extracted, exposing the screened lateral to the aquifer. The screen slot sizes varied depending on the coarseness of the material encountered. Sieve analyses of samples collected during the drive pipe projection are included in Appendix B. The screens were installed using 10-foot long sections, with each section having 9.5 feet of its length screened. In addition to the screen, each lateral was installed with a 10-foot long section of blank stainless steel pipe extending from the caisson wall. Following installation, each of the new laterals were thoroughly developed utilizing the BoreBlast II® system. The development equipment was systematically projected throughout the entire length of each lateral.

### **TASK 4 – SITE CLEAN UP AND DEMOBILIZATION**

Following installation and development of the new laterals, the interior of the caisson was power washed from the top slab to the caisson floor. Once completed, all sediment/debris was removed from the bottom of the well. Triangle Pump and Equipment, Inc. reinstalled Pump No. 3 on July 1<sup>st</sup> and the well was placed back into normal operation. Pump Nos. 1 and 2 were reinstalled in the following days. Photographs taken to illustrate the layout of the new and existing laterals in the bottom of the well are presented in Appendix C.

With the well in normal operation, a centrifugal sand-separating device manufactured by the Roscoe Moss Company of Los Angeles was installed on the discharge line to measure sand production per Section 15100 of the contract specifications. For development to be considered successful, the sand production from all screen lines combined was to be less than 2 parts per million (ppm). The sand tester was allowed to run for a period of about 2 days with just a trace amount of sand (few grains) being collected, confirming that sand production was well below the 2 ppm limit. All equipment was then removed from the well site and the site returned to original state.

### **TASK 5 – POST-MAINTENANCE EVALUATION**

On July 3, 2014, a diver entered the well to conduct lateral flow analysis while the well was in normal operation. Post-maintenance testing was conducted to evaluate the effectiveness of the work performed. A hydrogeologist experienced in testing horizontal collector wells

supervised the testing and collected water and pumping rate data. All measurements of water level and drawdown were made to within 0.01 foot.

#### **TASK 6 – DOCUMENTATION REPORT**

All data/information collected was evaluated, with the findings organized into this report. This report details the lateral installation and redevelopment procedures and results, with recommendations for the continued operation of the collector well.

## 3 RESULTS

### 3.1 NEW LATERAL INSTALLATION

The centerline of the new 12-inch laterals (designated Laterals 1, 2 and 3) in the caisson is at an elevation of -9.0 feet NAVD88. The new laterals are slightly lower than existing Lateral Nos. 3B (-7.8 feet) and 4B (-6.7 feet) and above existing Lateral 2A (-11.5 feet).

Initially, it was planned to install three (3) 150-foot laterals for a total lineal footage of 450 feet. However, fine materials encountered during the installation of Lateral 1 resulted in the lateral only being installed to a length of 120 feet. In order to achieve a total lineal footage of 450 feet, Lateral 2 and 3 were extended to 160 and 170 feet, respectively. Table 1 summarizes pertinent information on collector and screen design for each lateral, with plan and section views of the well depicted on Figure 2. A map of the site illustrating the lateral layout is presented in Figure 3.

Screen slot size openings were based upon samples collected during lateral projection, with the sieve analyses being included in Appendix B. The screen slot openings for the new laterals varied between 0.020 inches and 0.125 inches. The total screen open area of the new screen, adjusting for couplings and blank sections, is 424 square feet. At the target maximum yield of 3.0 MGD, this equates to an average entrance velocity of 1.3 feet per minute (ft/min) assuming 50% blockage of the screen slots. Adjusting the 420 feet of new lateral screen for couplings the average approach velocity at the outside of the natural pack would be approximately 0.20 ft/min at 3.0 MGD. Average in-line velocity with just the new laterals would be 2.0 feet per second (ft/sec) at the target yield.

Existing Laterals 2A, 3B and 4B include only 143 lineal feet of screen (total) since the first 49 to 56 feet of each lateral is blank pipe. The screen openings for these older laterals are  $\frac{3}{8}$ -inch by 2-inch long punched slots. The open area for the three (3) older laterals is estimated to be about 73 square feet, which brings the total open area for the well to 497 square feet.

### 3.2 LATERAL FLOW ANALYSES RESULTS

The results of the post-maintenance lateral flow analyses are included in Table 2. The lateral flow meter unit that is operated by the diver was damaged preventing a determination of the flow velocity from each lateral. The diver was able to determine the relative flow from each lateral through feel and visual observations. The diver ranked the flow velocity from each lateral on a 1 to 5 scale, with 1 being the weakest flow. Using these results, new Laterals 2 and 3 accounted for about 61% of the total flow. The three (3) older laterals (2A, 3B & 4B) accounted for about 32% of the total flow. New Lateral 1 was the weakest producer accounting for about 7% of the total flow. This is consistent with the finer deposits encountered in Lateral 1, which resulted in its reduced length.

### **3.3 PERFORMANCE TESTING RESULTS**

To evaluate the effectiveness of the maintenance, water level recorders were installed in the Ranney Well and adjacent observation wells (TB2-12 and AAI-523) on August 4, 2014. The stage of the Lewis River was monitored by obtaining information from the National Weather Service gaging station located about 0.3 miles downstream at the CC Street bridge (NWS, 2014). The post-maintenance testing was conducted using the permanent installed pumping equipment. The discharge from the well was directed to the WTP through the permanent installed transmission main. The discharge rates were determined using the permanent meters installed on the three (3) filters at the WTP.

It is understood that the Ranney Well had generally been continuously operated following the completion of maintenance activities. Background monitoring of water levels under normal operation of the Ranney Well was begun on August 4<sup>th</sup>. During this period the well was operating at a rate of 1200 gpm. Figure 4 presents hydrographs at the collector well site during the background period and complete testing period.

Water levels for the Lewis River at the CC Street Bridge ranged from 7.45 to 9.69 feet, for an average of 8.1 feet during testing. Based upon data obtained for the period from January 2000 through August 2014, a water level of 8.1 feet is equaled or exceeded 87% of the time (USACE, 2014). As shown in Figure 4, the water levels in the wells rose and fell along with the stage of the Lewis River, which is influenced by tidal fluctuations and hydroelectric power plant discharges. This indicates that a good hydraulic connection exists between the river and underlying alluvial aquifer. A river efficiency of 59% was calculated, i.e. for every 1 foot of river level change the water level in the Ranney Well would change 0.59 feet. This river efficiency value was based on the comparison of the water level changes observed in the Ranney Well and river during the background monitoring under normal operation. A time lag of between 15 and 30 minutes was also noted.

The well was taken offline August 5<sup>th</sup> at 8:48 AM to allow water levels to recover prior to testing, which began at 11:00 AM. It was planned to conduct a modified step-drawdown test consisting of three (3) steps at rates and durations listed below:

<u>Step</u>	<u>Pumping Rate</u>	<u>Duration, hours</u>
1	700 gpm	1
2	1400 gpm	1
3	2100 gpm	10

During the last step, the turbidity and sediment content of the water being delivered to the WTP was too high preventing treatment of the water. The higher velocities at 2100 gpm were dislodging the buildup within the transmission pipeline to the WTP resulting in the highly turbid water. The last step was cut short after 2 hours of pumping to let things settle down at the WTP. After about 30 minutes the well was placed back into service at 1200 gpm and water levels were monitored until the morning of August 6<sup>th</sup>. Water level data collected throughout the testing period are included in Appendix D.

A summary of the step-drawdown test results is given in Table 3. Hydrographs of the observed water levels in the Ranney Well and observation wells during the step-drawdown testing period are shown on Figure 5. A semi-logarithmic plot showing the time-drawdown relationship in the collector well is presented in Figure 6.

With the pumping rates reportedly varying from 700 gpm to 2100 gpm, the observed specific capacity values at the end of each step ranged from 352 to 479 gpm/ft at 56° F. The lowest specific capacity value coincided with the lowest pumping rate bringing into question the accuracy of the flow meter at the lowest rate. The specific capacity values for the 2<sup>nd</sup> and 3<sup>rd</sup> steps were similar indicating that the pumping rates for these steps were more accurate. Additionally, the observation wells drawdown differential values determined at the end of the first step were considerably higher than those determined for the later steps. The drawdown differential values at the end of the 3<sup>rd</sup> step at AAI-523 and TB2-12 were 1.2 and 1.7 feet of drawdown per 1000 gpm (feet/1000 gpm), respectively. These drawdown differential values indicate that the Ranney Well is operating efficiently and is delivering most of the water available in the aquifer.

Water levels were monitored for an additional 17 hours once the well was back in normal operation at a rate of 1200 gpm (Figure 4). Figure 7 presents a semi-logarithmic plot of the drawdown values adjusted for river level changes. To make the adjustments, the river efficiency value of 59% and a time lag of 30 minutes were used. As shown, the adjusted drawdown values exhibited very little change over the last 12 hours of pumping. This indicates that water levels had reached or nearly reached stability. The adjusted drawdown value at the end the monitoring period was 2.9 feet, equating to a specific capacity of 413 gpm/ft at 56° F.

## 4 ESTIMATED COLLECTOR WELL YIELDS

The results from the performance test were analyzed to determine the potential yield of the collector well under test conditions and assumed conditions. The yield from the collector well is dependent upon its efficiency, available drawdown and aquifer hydraulics. Available drawdown is directly related to the static groundwater level, which is affected by the stage of the Lewis River. Aquifer hydraulics are related to saturated thickness, hydraulic conductivity, boundary conditions and recharge (including temperature of the recharging water). Taking these variables into consideration, it is possible to project the yield of the collector for varying conditions using the following equation:

$$Q_2 = \frac{Q_1 \times m_2 \times s_2 \times v_1}{m_1 \times s_1 \times v_2}$$

Where:

Q = yield (gpm) of collector well under test ( $Q_1$ ) and design ( $Q_2$ ) conditions;  
s = drawdown (ft) in collector well under test ( $s_1$ ) and design ( $s_2$ ) conditions;  
m = aquifer thickness (ft) corrected for dewatering under test ( $m_1$ ) and design  
( $m_2$ ) conditions; and  
v = viscosity coefficient under test ( $v_1$ ) and design ( $v_2$ ) temperature conditions.

Substituting the observed data from the post-maintenance evaluation (test conditions) into the above equation and using the information presented below, it is possible to estimate the maximum yield of the collector well under varying conditions.

### Yield Conditions

Top of Aquifer	Assumed to be at River Elevation
Base of Aquifer	-15      Feet
Static Groundwater Level (assumed to be river level)	
Test conditions (average during test)	8.1      Feet
Average Conditions	9.5      Feet
Low Condition	7.7      Feet
Pumping Level	
Test Conditions (1200 gpm)	5.2      Feet
Design Minimum Pumping Level (5 feet above Center Line of uppermost Lateral 4B)	-1.7      Feet
Water Temperature / Viscosity Coefficient	
Test Conditions	56 ° F / 1.00
Average Conditions	55 ° F / 1.08
Winter Conditions	45 ° F / 1.26

The average and low river level values were based on data obtained for Lewis River Gage at the CC Street bridge for the period of record from January 2000 through August 2014 (USACE, 2014). The average river level was based on a river stage at the gage that was equaled or exceeded 50% of the time. The low river value was based on a stage that was equaled or exceeded 95% of the time. The minimum recommended pumping level was selected to keep the water level in the well at least 5 feet above the centerline elevation of Lateral 4B, the uppermost lateral in the well.

Figure 8 presents the projected yields and estimated drawdown values for the various conditions and are based upon calculations using the above equation. As shown, the well in its current condition is more than capable of yielding in excess of the target yield of 2100 gpm (3 MGD), even under low winter conditions. The accuracy of the yield predictions will depend on how well the assumed conditions match the actual conditions. The long-term yield of the collector well will ultimately be dependent on the recharge available to the aquifer and aquifer boundary conditions. Yields will also tend to decrease with time due to mineral/bacterial plugging of the well screen slots and formation materials adjacent to the well screens.

## 5 SUMMARY AND RECOMMENDATIONS

Ranney has completed maintenance on the City of Woodland's horizontal collector well as part of the Ranney Well Improvement Project. The maintenance activities completed included the redevelopment of three (3) existing 10½-inch laterals and the installation of three (3) new 12-inch diameter laterals. The centerline of the laterals in the caisson is at an elevation of -9.0 feet. The installed laterals have lengths that vary from 120 feet to 170 feet long, for a total lineal footage of 450 feet. The total screen open area for the new 12-inch laterals is 424 square feet, with the existing 10½-inch laterals adding another 73 square feet.

Ranney conducted performance testing of the well following the installation of the new laterals and redevelopment of the older existing laterals. Results of the testing were very favorable, increasing the specific capacity of the well from about 40 gpm/ft to over 400 gpm/ft. Additionally, the drawdown differential data showed the Ranney Well to be very efficient in delivering the available water.

Analyses of the testing results were very favorable, indicating that the collector well is capable of yielding in excess of the target yield of 3 MGD, even under the assumed winter low river flow conditions. The refurbished Ranney Well should provide the City with an efficient, dependable source of water.

It is recommended that a well monitoring program should be initiated that includes collection of such essential data as: 1) Pumping Rates, 2) Pumping levels in the Ranney Well and the adjacent observation wells, 3) Static water levels in the collector and adjacent observation wells, and 4) Water temperature of the pumped water. Initially these data should be collected on at least a monthly basis. This program will provide a current and accurate determination of the operating trend of the collector well enabling the tracking of the efficiency and yield potential of the well and impact upon surrounding wells under varying recharge conditions. This will allow future maintenance requirements to be easily assessed and scheduled at opportune times.

Notes: Pumping period started on 8/5/14 at 11:00 AM.

Lewis River elevation obtained from National Weather Service gage station located 0.3 miles downstream at the CC Street bridge.

## **APPENDIX A**

### **Test Borings and Observation Well Logs**

Ranney Collector Wells

**RANNEY COLLECTOR WELLS**  
6360 HUNTLEY ROAD  
COLUMBUS, OHIO 43229  
**614-888-6263**

**FIELD BOREHOLE LOG**  
BOREHOLE NO.: TB1-12  
TOTAL DEPTH: 55 feet

**CLIENT:** City of Woodland, WA

**JOB NO.:** 20234

**SITE LOCATION:** About 75 feet SE of the existing collector well building  
SW corner. Boring along top of riverbank.

**DATE DRILLED:** 12/10/2012

**COORDINATES:** N 5,084,073 m E 520,163 m UTM NAD 83

**GEOLOGIST:** Jay Bell, Layne

**TOP OF CASING ELEVATION:**

**DRILLER:** Josh P., Boartlongyear  
**BORING DIAMETER:** 6 inches

**GRADE ELEVATION:** 35.2 Feet NAVD88

**DRILLING METHOD:** Rotasonic - spider

**NOTES:** Coordinates Not Surveyed, approximately determined with Google earth.  
Grade Elevation referenced from collector well top slab just outside door.  
Water level 21.2 feet below ground surface at 08:27 on 12/11/12.

DEPTH (feet)	ELEVATION (feet)	LITHOLOGY	RECOVERY	WELL CONSTRUCTION	WELL DESCRIPTION
0	35	Brown, Topsoil.	0 to 5 feet, 5 feet recovery		
3	32	Brown, SAND, fine to medium sand, mostly fine, loose, uniform, clean.			
4	31	Light Brown, SILTY SAND, fine sand.			
5	30	Gray, SAND, fine to medium sand, thin layers of coarse material (medium/coarse sand) with pumice material.	5 to 10 feet, 5 feet recovery		Boring abandoned with bentonite.
10	25	As Above, larger pieces of pumice at 14 feet, medium gravel size, rounded pumice.	10 to 15 feet, 5 feet recovery		
15	20	Gray/Brown, SAND, fine to medium sand, 50/50 mix, thin coarser layers approx. 1-inch thick with pumice pieces, loose. At 19 feet, 2-inch thick brown silty sand lens, very fine to fine sand in lens, dense.	15 to 20 feet, 5 feet recovery		
20	15	Gray (darker), SAND, fine to medium sand, uniform, loose, less coarser layers with pumice than above material, damp to wet.	20 to 25 feet, 5 feet recovery	☒	
25	10	Gray/Brown, As Above, wet.	25 to 30 feet, 5 feet recovery		
30	5		30 to 35 feet, 5 feet recovery		

Ranney Collector Wells

**RANNEY COLLECTOR WELLS**  
6360 HUNTLEY ROAD  
COLUMBUS, OHIO 43229

BOREHOLE NO.: TB2-12 (BHN-885)  
TOTAL DEPTH: 55 feet

**CLIENT:** City of Woodland, WA

**SITE LOCATION:** About 82 feet NW of the existing collector well building corner. Boring along concrete barrier near 35 mph sign.

**COORDINATES:** N 5,084,119 m E 520,134 m UTM NAD 83

**TOP OF CASING ELEVATION:** 36.7 Feet NAVD88

**GRADE ELEVATION:** 37.0 Feet

**JOB NO.:** 20234

**DATE DRILLED:** 12/11/2012

**GEOLOGIST:** Jay Bell, Layne

**DRILLER:** Josh P., Boartlongyear

**BORING DIAMETER:** 6 inches

**DRILLING METHOD:** Rotasonic - spider

**NOTES:** Coordinates Not Surveyed, approximately determined with Google earth.

Grade Elevation referenced from collector well top slab just outside door.

Water level 23.9 feet below ground surface at 10:12 on 12/12/12. Well Tag # BHN-885

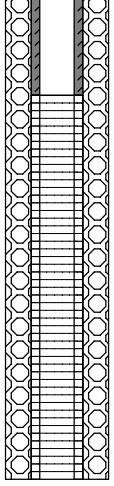

DEPTH (feet)	ELEVATION (feet)	LITHOLOGY	RECOVERY	WELL CONSTRUCTION	WELL DESCRIPTION
0	35	Brown, Topsoil, overbank deposits.  Brown, SILT with Sand (fine) layers, possible fill material, dense.	0 to 5 feet, 5 feet recovery		8" flush mount manhole cover
5	30	Brown, SILTY SAND, with thin lenses of clean fine sand.	5 to 10 feet, 5 feet recovery		6" borehole
10	25	Brown, SILTY SAND to SANDY SILT, sand fine to medium grained, orange mottling present.  As Above, less silt.	10 to 15 feet, 5 feet recovery		2" PVC Casing, threaded joints
15	20	Gray to Gray/Brown, SAND, sand fine to medium, with thin < 1-inch thick silt lens.	15 to 20 feet, 5 feet recovery		
20	15	Gray/Brown, SILTY SAND to SAND, mostly fine sand, dense, holds shape.	20 to 25 feet, 5 feet recovery		Bentonite seal placed in annulus
25	10	Gray (Darker), SILTY SAND, sand fine to medium grained, mostly fine, uniform, trace scattered pumice pieces (rounded).	25 to 30 feet, 5 feet recovery		
30	5	As Above, less silt, uniform. Small black wood fragments.	30 to 35 feet, 5 feet recovery

# WATER WELL REPORT

STATE OF WASHINGTON

Start Card No. R 13592

UNIQUE WELL I.D. # AAI 523

Water Right Permit No. \_\_\_\_\_

(1) OWNER: Name City of Woodland

Address 100 Davidson, Woodland, WA 98674

(2) LOCATION OF WELL: County Cowlitz

SW 1/4 SW 1/4 Sec 18 T.5 N.R. 1 W.M.

(2a) STREET ADDRESS OF WELL (or nearest address) 1381 Lewis River Rd., Woodland, WA

(3) PROPOSED USE:  Domestic  Industrial  Municipal  
 Irrigation  Test Well  Other

(4) TYPE OF WORK: Owner's number of well  
(If more than one)

Abandoned  New well  Method: Dug  Bored   
Deepened  Cable  Driven   
Reconditioned  Rotary  Jetted

(5) DIMENSIONS: Diameter of well 6 inches  
Drilled 58'10" feet. Depth of completed well 58'10" ft.

(6) CONSTRUCTION DETAILS:

Casing installed: 6 Diam. from +1'6" ft. to 45 ft.  
Welded  Ext. diam. from 43'3" ft. to 45 ft.  
Liner installed  Diam. from 50 ft. to 58'10" ft.  
Threaded  Diam. from 50 ft. to 58'10" ft.

Perforations: Yes  No

Type of perforator used \_\_\_\_\_

SIZE of perforations \_\_\_\_\_ in. by \_\_\_\_\_ in.  
perforations from \_\_\_\_\_ ft. to \_\_\_\_\_ ft.  
perforations from \_\_\_\_\_ ft. to \_\_\_\_\_ ft.  
perforations from \_\_\_\_\_ ft. to \_\_\_\_\_ ft.

Screens: Yes  No

Manufacturer's Name Johnson

Type stainless steel Model No. \_\_\_\_\_  
Diam. 6 Slot size  25 from 45 ft. to 50 ft.  
Diam. \_\_\_\_\_ Slot size \_\_\_\_\_ from \_\_\_\_\_ ft. to \_\_\_\_\_ ft.

Gravel packed: Yes  No  Size of gravel \_\_\_\_\_

Gravel placed from \_\_\_\_\_ ft. to \_\_\_\_\_ ft.

Surface seal: Yes  No  To what depth? 20 ft.  
Material used in seal Hole plug & quick gel

Did any strata contain unusable water? Yes  No

Type of water? \_\_\_\_\_ Depth of strata \_\_\_\_\_

Method of sealing strata off \_\_\_\_\_

(7) PUMP: Manufacturer's Name \_\_\_\_\_

Type: \_\_\_\_\_ H.P. \_\_\_\_\_

(8) WATER LEVELS: Land-surface elevation

above mean sea level \_\_\_\_\_ ft.

Static level 28'6" ft. below top of well Date 11-5-93

Artesian pressure \_\_\_\_\_ lbs. per square inch Date \_\_\_\_\_

Artesian water is controlled by \_\_\_\_\_ (Cap, valve, etc.)

(9) WELL TESTS: Drawdown is amount water level is lowered below static level

Was a pump test made? Yes  No  If yes, by whom? Driller

Yield: 12 gal./min. with 3" ft. drawdown after 1 hrs.

" " " "

" " " "

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)  
Time Water Level Time Water Level Time Water Level

Time Water Level Time Water Level Time Water Level

Date of test \_\_\_\_\_

Baker test \_\_\_\_\_ gal./min. with \_\_\_\_\_ ft. drawdown after \_\_\_\_\_ hrs.

Airtest \_\_\_\_\_ gal./min. with stem set at \_\_\_\_\_ ft. for \_\_\_\_\_ hrs.

Artesian flow \_\_\_\_\_ g.p.m. Date \_\_\_\_\_

Temperature of water \_\_\_\_\_ Was a chemical analysis made? Yes  No

## (10) WELL LOG or ABANDONMENT PROCEDURE DESCRIPTION

Formation: Describe by color, character, size of material and structure, and show thickness of aquifers and the kind and nature of the material in each stratum penetrated, with at least one entry for each change of information.

MATERIAL	FROM	TO
Brown sand gravel	0	20
Grey brown sand	20	28
Grey brown sand (water)	28	35
Brown sand gravel (water)	35	50
Grey silty clay	50	53
Grey silt	53	58'10"

Hardness 3

Iron 1.1

PH 6.0

Work Started 11-3-93, 19. Completed 11-5-93, 19

## WELL CONSTRUCTOR CERTIFICATION:

I constructed and/or accept responsibility for construction of this well, and its compliance with all Washington well construction standards. Materials used and the information reported above are true to my best knowledge and belief.

NAME Hansen Drilling Co., Inc.

(PERSON, FIRM, OR CORPORATION) (TYPE OR PRINT)
